

From Passive Chatbots to Autonomous Orchestration

Demystifying the evolution of AI capabilities: Generative AI, AI Agents, and Agentic Systems.

THINK
Generative AI

DO
AI Agents

COLLABORATE
Agentic Systems

Most people use 'AI' to mean a text generator. But the technology has evolved into three distinct tiers of capability. This deck uses a single 'Travel Planner' case study to demonstrate how we moved from simple answers to complex, autonomous problem solving.

The Core Metaphor: The Brain and The Hands

The Brain (LLM)

It holds knowledge, understands language, and reasons. But it is paralyzed; it cannot interact with the outside world.

The Hands (Tools & APIs)

The mechanisms to manipulate the world—booking a flight, searching live data, or sending an email.

The evolution of AI is defined by how we connect the Brain to the Hands.

Level 1: Generative AI is a Knowledge Retrieval Engine

Offline / Pre-Trained Mode

Plan a 3-day trip to Australia.

Here is a suggested itinerary for Sydney:

Day 1: Visit the Opera House...

Day 2: Bondi Beach...

Day 3: Harbour Bridge Climb.

Key Characteristics

- **Mechanism:** Large Language Model (LLM).
- **Source:** Pre-training (Static knowledge learned from the internet up to a specific cutoff date).
- **Limitation:** Knowledge Cutoff. It cannot access live flight prices or events happening today.
- **Verdict:** Passive. It generates text based on the past. It cannot DO anything.

The Wall: Why GenAI Cannot 'Book' Your Trip

The Failure: A standard LLM is isolated. It lacks the "Hands" to reach out and execute a transaction. To solve this, we must add Tools.

Level 2: AI Agents Connect the Brain to Tools

The AI Agent (Green Box)

Definition: An AI Agent is a system where the LLM is given access to external 'Tools' (Search, APIs, Databases). It moves from Generating to Doing.

Agents are Autonomous but Narrow

Flight Booking Agent

1. Input

A clear, singular goal.

'Book flight'

2. Reasoning

The LLM selects the right tool.

'I need to check prices, calling Expedia API...'

3. Action

Execution without human intervention.

Constraint

The Limitation

It is task-specific. This agent creates a booking, but it does not know if you have a valid Visa or if the weather will be stormy. It lacks the bigger picture.

Level 3: Agentic AI Handles Complex, Multi-Variable Goals

“Plan a 7-day trip to New Delhi in May. Budget under \$600. Weather must be sunny. And check if I need a Visa.”

A single narrow agent cannot solve this. The prompt requires coordination across different domains. We need a team.

The Orchestration of Multiple Agents

Multi-step Reasoning: The system connects the dots. If the Immigration Agent flags an issue, the Orchestrator stops the Travel Agent from spending money.

Agentic AI Mimics Human Reasoning

When humans plan, we don't just execute. We check dependencies.

Agentic AI replicates this through:

- Multi-step Planning
- Shared Memory
- Failure Handling (Retrying if a plan fails)

The Capability Ladder at a Glance

	GenAI	AI Agent	Agentic AI
Core Component	LLM Only	LLM + Tools	Multiple Agents + Memory + Planning
Input	Prompt	Goal	Complex Problem
Output	Text / Media	Completed Task	End-to-End Solution
Autonomy	None (Passive)	Task-Specific (Narrow)	High (Plan, Execute, Retry)
Analogy	The Brain	Brain + Hands	A Team of Experts

Real-World Application: Automated HR Onboarding

Beyond travel, Agentic AI transforms enterprise workflows.

ROI: The system handles the entire lifecycle of a business process, connecting disparate apps (HRMS, Outlook, Jira) autonomously.

The Technology Stack for Agentic Systems

The Engine (LLMs)

The reasoning core.

 Gemini

 GPT-4

 Claude

Visual Builders

Drag-and-drop workflow creation.

 n8n

Low-Code Orchestration

Code Frameworks

For developers building complex agents.

 LangGraph
(Graph-based flows)

 CrewAI
(Role-playing agents)

 Agno
(formerly Phidata)

 Microsoft AutoGen

The Future is Goal-Driven, Not Prompt-Driven

We are moving away from systems that require perfect prompts to get good answers, toward systems that accept high-level goals and figure out the path themselves.

The true power of AI lies not in generation, but in orchestration.
